

For **Priya Shah**, the missing item is the **beneficiary designation document**. Her ground-truth data says the beneficiary should be **Arjun Shah, 100%**, but the package intentionally does not include the beneficiary form. So the system should say something like: “Beneficiary information is expected for this Roth IRA transition, but no beneficiary designation document was provided.”

For **Marcus Lee**, there are two discrepancies. His existing statement lists the address as **350 Prototype Road**, while the new account application lists **305 Prototype Road**. Separately, the new application lists his risk tolerance as **Conservative**, while the investor profile says **Moderate**. Neither necessarily means the transition is invalid, but both need human review, which is why the package is marked **Flagged**.

For **Elena Rodriguez**, “complex” means the system has to deal with several different types of issues at once rather than one simple missing field. There are four seeded problems: the statement says **Elena M. Rodriguez** while the application says **Elena Rodriguez**; the transfer form estimates the account at **\$603,145.75** while the statement says **\$638,145.75**; the transfer form is **missing a signature**; and the application says **Balanced Growth** while the investor profile says **Aggressive Growth**.
